

STRUCTURES	
FOUNDATION	The foundation is an existing structure of the building, constructed during the previous phase and consisting of cast reinforced concrete panels.
LOAD-BEARING WALLS	The load-bearing walls are made of cast reinforced concrete.
INTER-FLOOR SLABS	The inter-floor slab is made of cast reinforced concrete.
EXTERNAL WALLS	The load-bearing external walls are built using cast reinforced concrete, while aerated concrete blocks were used to erect the rest of the external walls. Polystyrene foam was mainly used to insulate the envelope structures of the building, although walls with a fire safety or fire separation function were insulated using rock wool. A decorative facade finish is to be applied to the walls. The walls of the attic floor consist of timber structures, with a ventilated facade.
ROOF	The roof will be a cast reinforced concrete slab, except for the last floor, for which timber structures will be used. The roof is insulated with rock wool and lined with a PVC membrane.
WALLS BETWEEN SHARED-USE AREAS AND APARTMENTS	The walls were built using aerated concrete blocks, with plastering on the side of the shared-use areas and lined with two layers of plasterboard on the inner side, with rock wool insulation between the plasterboard layers.
WALLS BETWEEN APARTMENTS	The walls were built as a three-layer system. It consists of a fire-resistant section in the middle, lined with two layers of plasterboard, and 75 mm rock wool insulation filling on both sides.
PARTITION WALLS WITHIN APARTMENTS (BETWEEN ROOMS)	The partition walls were made using metal frames (50, 75, 100 mm), lined with plasterboard and rock wool filling on both sides.
WINDOWS	The building is to have 3-pane PVC glass unit windows. EI30 fire resistance class windows are set up in the fire-resistant walls.
BUILDING EXTERNAL DOORS	The external doors of the building are to be made of aluminium with 3-pane glass unit glazing.
TERRACES	Impregnated timber decking supported by spacers is used for the end finish. The terraces are equipped with an outdoor wall socket. Metal railings were used as enclosures for the terraces. The terraces are separated using a metal screen similar to the terrace railings. The separating wall can be optionally equipped with terrace or flower boxes.
STAIRS AND RAILINGS	Prefab concrete stair spans and landings. Painted metal railings.
LIFT	The building is to have a lift that can stop on every floor.

SHARED-USE AREAS	There is to be a shared-use room on Floor 1 for storing bicycles and baby carriages. The premises will be equipped with an access control system.
GROUNDS, IMPROVEMENTS	The grounds have been improved with paving stone surfacing, lanterns, and multiple recreation areas with benches. A number of greenery arrangements are being set up in fixed flower boxes. Bicycle parking facilities have been installed on the grounds.
UNDERGROUND STOREYS	The basement floor of the building consists of two levels, Floor -1 and Floor -2, with spaces for parking cars, motorcycles, bicycles, as well as storage rooms and electric vehicle charging options.

* The solutions indicated in the technical description may change without prior notice, and be replaced with equivalent or technologically equivalent alternative solutions that comply with the construction design and do not degrade the level of quality.

UTILITY SYSTEMS	
HEATING	The centralised municipal heating system is used for heating the building. PURMO radiators are being installed in the apartments. Every bathroom unit is to be equipped with electric towel driers and electric underfloor heating. Remote meter reading.
AIR COOLING	Air-cooling infrastructure is being installed in the two-room apartments on the 5 th floor of the building. The client will install the internal and external units of the cooling system at their own expense.
WATER SUPPLY	Centralised city water supply and sewer. The cold and hot water meters for every apartment are located in the shared-use areas. Remote meter reading.
POWER SUPPLY	An independent connection to the power supply system is to be set up for every apartment. The power meters are installed in the switching box of the respective floor. It is planned to install wall sockets and light switches, as well as connection points for kitchen appliances. The suspended-ceiling areas of the apartments are to have built-in lights; the rest of the lights will be set up by the owners of the apartments according to their own means and preferences. The shared-use areas are to be equipped with motion sensors for lighting control.
VENTILATION	Every apartment is designed to have its own ventilation system. Outdoor heat recovery units are to be installed in the external walls of every habitable room of the apartments. Every bathroom unit is to have a ventilation exhaust, extracting the air on the roof.
TELECOMMUNICATIONS	A fibre-optic cable is installed up to every apartment, located in the telecommunications switching box.
SECURITY MEASURES	Intercoms are installed at the entrances of the buildings, and every apartment is equipped with an intercom station. The grounds are closed down at night. Local smoke detectors are to be installed in every apartment, and centralised smoke detectors in shared-use areas.
